

Arquitetura e Gestão de Redes - Second Project

Tasks:

1. Traffic from Coimbra should go preferably by Lisboa, while traffic from Aveiro should go preferably by Porto
2. National providers should not transport traffic between other national providers and the International provider
3. In order to reduce costs and have a better security control, the Sales Department of CompanyA required a virtual private connection between the Aveiro and Lisboa poles, with a guaranteed bandwidth of 2Mbps. All Videoconference traffic between the Aveiro and Lisboa poles of CompanyA should use this private connection.
4. Due to security requirements, traffic between the Leiria and London networks should be encrypted.
